

Skunk spray

One approach is to accept the smell -- maybe it wouldn't matter too much, and might be a good thing. Some people don't mind the smell too much and in any case you would smell less human with skunk odor.

Charcoal/ ash. Is masks most odors, would probably help with the skunk.

Stinging nettle juice... It is acidic and would probably break up whatever stinks

Some acid mixture from the ants (the large army ants), crush and smear on yourself. Then a mix of sweet gale and sweet fern wash or a "strong" brewed birch wash ([Allan "Bow" Beauchamp](#))

Roll in the mud, slather it all over. Probably would take a week or more to go away completely.

Urine

Try boiled and steeped pine needles.

Try plants in the same family as tomato, and also Creosote bush.

The smelly stuff from Mr. Skunk is an oily material so do whatever you can to remove oil. Lots of water and any soap-like material you can find will eventually remove much of the oil. The problem is it only takes a small amount of the oil to saturate your smeller, so at first you won't be able to tell you are doing any good.

If you have access to baking soda to add to your soap solution you will probably be doing as much as possible in the wilderness setting. If you also have hydrogen peroxide to add to the soda-soap mixture you will have the best known formulation for eliminating the smell. The latter combination works very well and very fast.

In my experience tomato juice doesn't really work to remove the skunk oil. It does cover up the smell somewhat if it's not too strong, but as the smell of the tomato dissipates the skunk smell comes back.

If you ever get sprayed in the eyes by a skunk, you will go blind for up to five hours afterward, with the eyes burning like they are on fire. Rinsing the eyes immediately with urine, will neutralize the blinding spray.
